INTRODUCTION
The geology of the Napoleon Hill quadrangle has been described by previous studies. This map builds on that work by providing a more detailed and updated representation of the geologic units and structures. The main goals of this map are to:

- Provide a comprehensive geologic map of the area.
- Outline major geologic units and contacts.
- Show structures such as faults and folds.
- Include data on mineral occurrences.

GEOPHYSICAL DATA
The geophysical data used in this map includes gravity and magnetic anomaly data. These data were collected and interpreted using standard techniques.

DESCRIPTION OF MAP UNITS
This section provides a detailed description of the geologic units present in the Napoleon Hill quadrangle.

LOCATION OF FIELD OBSERVATIONS
Field observations were made at various locations within the quadrangle. These locations are shown on the map.

SYMBOLS
The symbols used on the map include:

- Solid line: Contact.
- Dotted line: Fault.
- Red: Mesozoic rocks.
- Yellow: Cenozoic rocks.
- Green: Proterozoic rocks.

REFERENCES
This map is based on previous work by various authors, including:

- Connor and Evans, 1986.
- Lewis and others, 2022.

ACKNOWLEDGEMENTS
The authors wish to acknowledge the contributions of:

- Umpleby (1913).
- Johnson and others, 1998.
